1. (a) since f(x) is differentiable at q(a)

$$\lim_{y\to g(a)} \frac{f(y)-f(g(a))}{y-g(a)} = f'(g(a)).$$

That is to say as y becomes arbitrarily dose lbut not equal) to g(a) the difference ratio becomes arbitrarily dose to f'(g(a)).

On the other hand, by assumption, y(x) #g(n) when x +n and

$$\lim_{x\to a}g(x)=g(a)$$

since g(x) is continuous at a. That is, as x brames arbitrarily close (but not equal to) a, g(x) becomes aubitrarily close (but not equal to) g(n).

Together these facts imply that as x becomes. arbitrarily close to a, g(v) becomes arbitrarily close to g(a), this

becomes arbitrarily done to filglas) i.e.

$$\lim_{k\to n} \frac{f(g(k)) - f(g(n))}{g(k) - g(n)} = f'(g(n))$$

(b) Since g(x) is differentiable at a, it is continuous at a. We thus find that

$$h'(n) = \lim_{x \to \alpha} \frac{h(x) - h(\alpha)}{x - \alpha} = \lim_{x \to \alpha} \frac{f(g(x)) - f(g(\alpha))}{x - \alpha}$$

$$= \lim_{x \to \infty} \left(\frac{f(g(x)) - f(g(x))}{x - \alpha} \right) \times \left(\frac{g(x) - g(\alpha)}{g(x) - g(\alpha)} \right)$$

$$= \lim_{x \to \infty} \left(\frac{f(g(x)) - f(g(\alpha))}{g(x) - g(\alpha)} \right) \times \left(\frac{g(x) - g(\alpha)}{x - \alpha} \right)$$

$$= \lim_{x \to \infty} \left(\frac{f(g(x)) - f(g(\alpha))}{g(\alpha) - g(\alpha)} \right) \times \lim_{x \to \infty} \left(\frac{g(x) - g(\alpha)}{x - \alpha} \right)$$

$$= f'(g(\alpha)) g'(\alpha)$$

$$= f'(g(\alpha)) g'(\alpha)$$
Where in line (*) we've uses (a) and the product rule for linits.

2. (a) $f'(x) = H(5x^6 + 2x^3)^{4-1} \cdot (5 \cdot 6x^6 + 2 \cdot 3x^2 + 1)$

$$= 4(5x^6 + 2x^3)^3 \cdot (30x^5 + 6x^2)$$

$$= \frac{1}{2} \int \frac{x+1}{x} \cdot \left(\frac{x+1 - x}{(x+1)^2} \right)$$

$$= \frac{1}{2} \int \frac{x+1}{x} \cdot \left(\frac{x+1 - x}{(x+1)^2} \right)$$

$$= -\sin(\sqrt{g^2 - 2}) \cdot \frac{1}{2} \cdot \frac{1}{6x^2 - 2} \cdot \frac{1}{6x^2 - 2}$$

$$= -\sin(\sqrt{g^2 - 2}) \cdot \frac{1}{2} \cdot \frac{1}{6x^2 - 2} \cdot \frac{1}{2} \cdot \frac{1}{6x^2 - 2} \cdot \frac{1}{2} \cdot \frac{1}{6x^2 - 2}$$

$$= -\sin(\sqrt{g^2 - 2}) \cdot \frac{1}{2} \cdot \frac{1}{6x^2 - 2} \cdot \frac{1}{2} \cdot$$

This the target line at (2,3) is

$$y = 3 + 2(x - 2) = 2x - 1$$

(b) $y' = \cos(\sin(x))\cos(x)$

at $x = \pi$ $y' = \cos(\sin(\pi))\cos(\pi)$
 $= \cos(0)(-1)$
 $= -1$

Thus the target line at $(\pi, 0)$ is

 $y = 0 - 1(x - \pi) = \pi - x$
